

Discinsanity Tags

A weekly bag-tag league app for South Mountain · Bethlehem, PA

Project overview · generated June 26, 2026

What it is

Discinsanity Tags is a phone web-app that runs the league's weekly **bag-tag** game: players compete for the lowest-numbered tag and swap tags based on how they finish. UDisc keeps score great, but it **won't reshuffle the tags** — the organizer was doing that math by hand every week. This app does it instantly, keeps the full history, and shows each player's progression — with a celebration when someone climbs.

The problem it solves

After every round the tags get re-handed-out: best finisher takes the lowest tag in play, and so on — **separately for each division** (Mixed Pro / Mixed Amateur), with absent players keeping their tag. By hand that is slow and error-prone. The app turns it into: pull in the scores → tap once → done.

Everything included

Per-division reshuffle

Present-only swap, golf scoring (low wins), hold-position ties. Each division has its own tag set and reshuffles independently.

↑ UDisc CSV import

Auto-detects name/score/division columns, skips the "Par" row, picks the latest round, and auto-fills who played plus their scores.

#1-tag & personal-best moments

Claiming the top tag triggers a full-screen gold celebration; beating your best-ever tag gets a callout. Confetti throughout.

Player profiles

Tag-progression graph (lower = better), the tags they moved through, round-by-round score history, and stats including a #1 streak.

League history

Every Tags night saved with date, course, and the full scorecard grouped by division. Trades are logged too.

Tag trading

Swap two players' tags or reassign one — within a division, keeping tags unique. Logged to history.

Standings + export

Live standings per division with a crown on each #1. Copy text for the group chat, download CSV, or a shareable standings page.

Access & roles

Date-password lock to view; a separate organizer code unlocks editing. Viewers cannot change scores; saved rounds are immutable.

Real branding

Logo and colors pulled from discinsanity.com — blue, gold, the Assistant typeface — with animations to make it feel alive.

Backend-ready

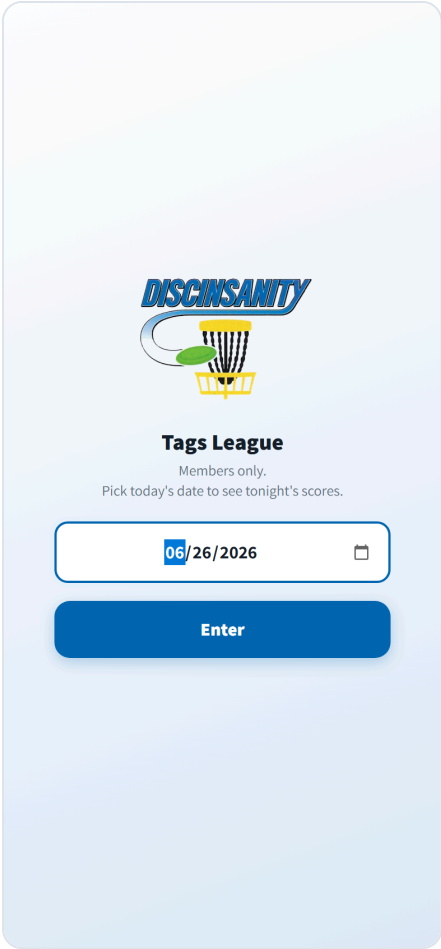

Runs offline in the browser (localStorage); paste Supabase keys to sync across phones. One self-contained file, hosted free on GitHub Pages.

How the workflow goes

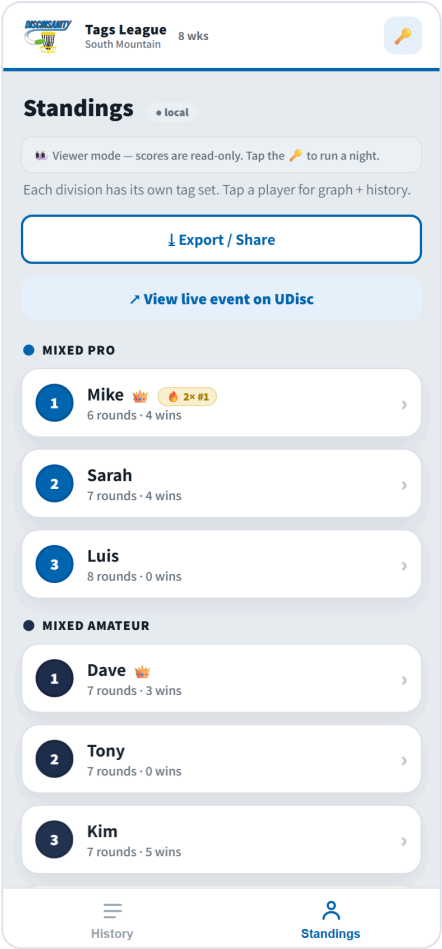

1

Unlock — open the link, pick today's date. Only people there that day get in.

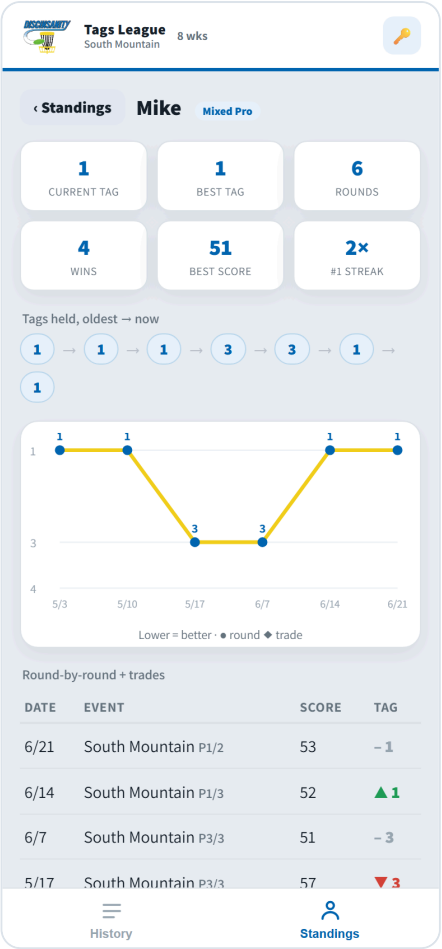

- 2 **View** — anyone can browse standings, player graphs and past scorecards (read-only).
- 3 **Go organizer** — tap the key, enter the code, to run the night.
- 4 **Import scores** — drop in the UDisc CSV; the roster auto-fills (present + score + division).
- 5 **Reshuffle** — tags recompute per division; best score takes the lowest tag in play.
- 6 **Save** — the new tags lock in, the week is filed, and milestones celebrate (#1, personal best).
- 7 **Share** — copy or export the standings for the group chat.

Notes

Honest caveats: the date/organizer lock is a *client-side* gate — fine for a private league, but real access control would need the cloud backend. The CSV parser is best-guess until we import a real Sunday export to lock the exact column names. Both are quick follow-ups.
